

Setting Instructions

Normal Crown: To set the time, pull the crown out fully (2 clicks) only if there is a quick set date position. Turn in either direction to set. Be sure to watch the calendar jump so you know when the date jumps that this is considered midnight. Push the crown in 1 click and turn it until the correct date is shown. If there is a day as well, turn the crown the opposite direction to set the day. After setting the time and date, be certain to push the crown in fully.

Screw-Down Crown: Setting the time and date with a screw down crown watch is the same as above; however, to pull out the crown you must first “unscrew” the crown by turning it in a counter clockwise direction until the crown releases from the treaded tube. After adjusting the time and/or date, push the crown in while screwing it down in a clockwise direction until the crown is sealed in a tight position. This is important to keep it water resistant.
